Ellementry AI Hub — Our Data Foundation

Oct 1, 2026 · @Rajat

We are bringing all of Ellementry's business data into one checked, trustworthy place, so dashboards and AI agents can answer questions about sales and stock with numbers everyone can rely on.

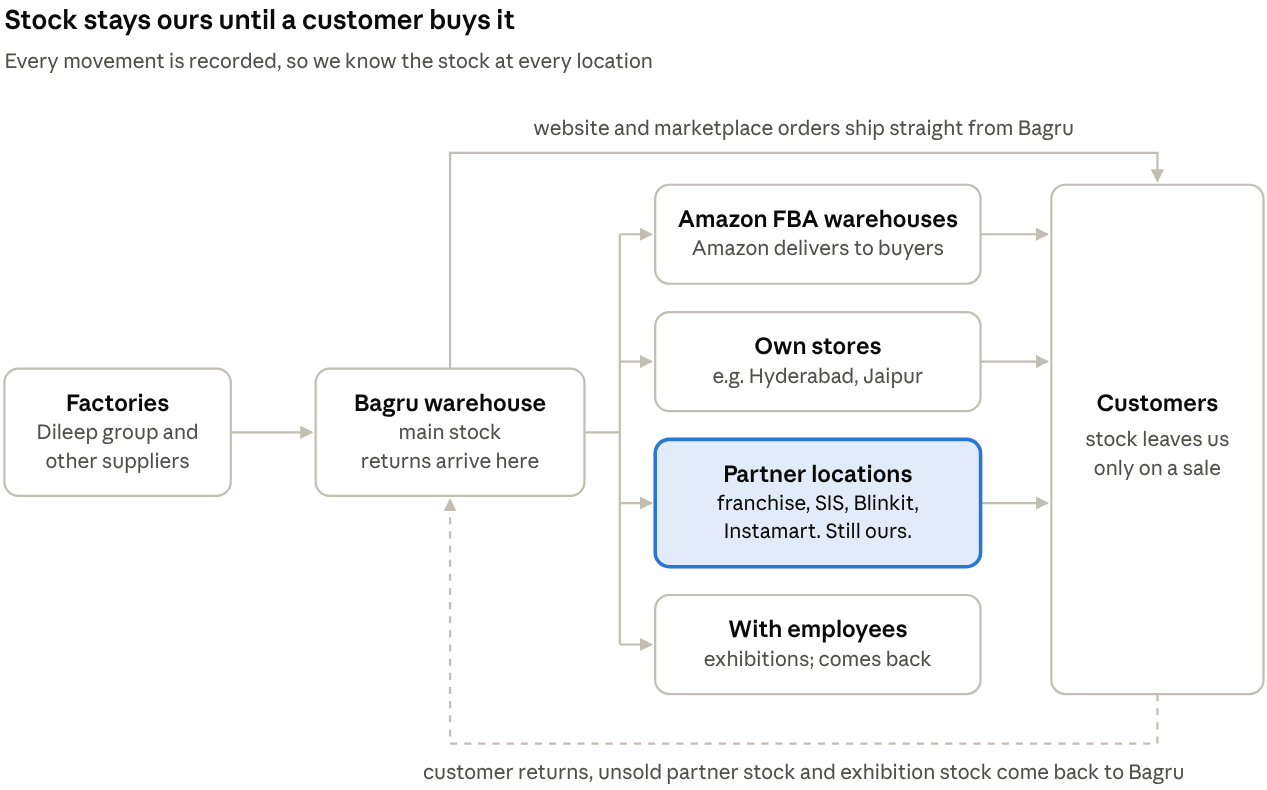

The big picture

big picture · sources, data foundation, dashboards and agents

Today 14 kinds of export from the ERP, the warehouse system, Blinkit, Instamart and the product master feed one data foundation. Amazon, Shopify and the ad platforms join later. Stock AI and Operations AI are built first.

How stock is tracked

how stock moves · factories to Bagru, out to locations, and back

Every movement in the picture is recorded: purchases, transfers, sales, returns and partner sell-through. That gives Stock AI the stock at every location on any day. Stock sent to franchise stores, SIS counters and quick-commerce partners is still counted as ours until they sell it, because they send back what doesn't sell.

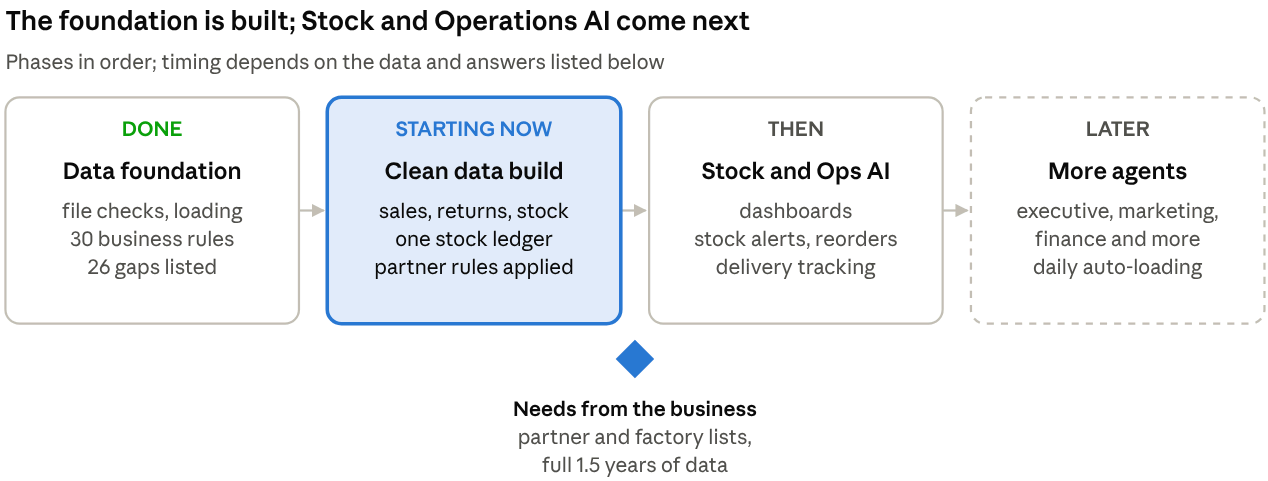

Why the numbers can be trusted

Six safeguards are built in, so a number on a dashboard can always be explained:

- **Every file is checked before it is accepted.** It must have exactly the expected columns and its totals must add up. A file that doesn't match is rejected and logged; nothing is ever half-loaded.
- **Nothing is changed on the way in.** The original contents are kept exactly as exported, and every number can be traced back to the file and row it came from.
- **Business rules are written down and numbered.** For example "headline sales exclude GST" and "exports go through Dileep at cost". There are 30 rules so far, each recording who confirmed it.

- **Gaps are shown, never hidden.** Where data doesn't exist yet, dashboards say "no data yet" rather than showing zero. 26 known gaps are listed, each with an owner.
- **Each thing is counted once.** Stock reported by both the ERP and Blinkit is counted once, and Blinkit's or Instamart's own sales figures are never added on top of our invoices.
- **Customer personal data stays locked away.** Analysis uses only pincode, city and state.

Where we are and what comes next

roadmap · four phases, one gate

The foundation is built and tested on sample exports. The next phase turns the data into clean sales, returns and stock figures; Stock AI and Operations AI follow. A few things only the business can provide decide how quickly that goes:

What we need	Why it matters	From
Save the stock report every day (ERP, Blinkit, Instamart)	Past stock can't be re-exported; each unsaved day is lost for good	ERP team
Names of franchise, SIS and quick-commerce partners	Separates final sales from stock that can still come back	Business
List of factories we buy from	Real supplier lead times for reordering	Business
Full warehouse dispatch export	Delivery speed, courier performance, returns	Operations

What we need	Why it matters	From
Shoppers Stop returns: one route or two?	Avoids counting returned stock twice	Business
Are any invoices in a foreign currency?	Correct revenue figures	Finance
